

Client Confirmation — Netwise

IA728001 Studio 5, Block 3, 2026 — Auckland International Campus

To whom it may concern,

I acted as the client for the Netwise project during Studio 5, Block 3, 2026. The team was **Netwise** where the team members are Arsh Vhora, Ankeet Patel, Shubham Kataria and Samika Perera.

Netwise is a tool that reads exported network device configuration files, finds security misconfigurations in them, and explains those findings in plain English. It runs entirely offline and does not connect to a live network.

During the project I:

- met the team to give the original requirements, including the two directions of translation I asked for — turning technical analysis output into plain English, and turning a plain-English instruction into a proposed configuration change;
- provided an anonymised export of my own pfSense firewall configuration for the team to test against;
- set the constraint that the tool must never push a change to a live device, and that configuration data must not be sent to any external service;
- gave feedback and correction at several points during the block, including on the scope of what was realistic.

I have seen the tool demonstrated. The team analysed a configuration file, showed the findings with the evidence behind each one, showed the plain-English explanations, and exported the result as a report.

I am satisfied with what was delivered against what I asked for.

The team were clear with me about what the tool does not yet do. In particular, two of its three analyses do not yet read a security policy written by the user, and the converter for my own firewall format cannot yet handle every construct in my configuration — it stops and says which ones instead of guessing. Four questions about my firewall are still with me for a decision. I regard both of these as honestly reported rather than hidden.
